

# Beyond Traditional Quantum Measurement

A game of quantum peek-a-boo with a purpose

PhD research of a CSUF alumni

## **Kyle Keane**

PhD candidate in physics  
University of California, Riverside  
Advisor: Alexander Korotkov

CSUF physics department colloquium

November 4, 2011

# Outline

- Background
    - Quantum Mechanics and Ideal Measurement
    - Real World Measurement
      - Example: Phase Qubit
    - Measurement Reversal
  - Where my story begins
    - Explaining experimental results
    - Discovery of new phenomenon
    - Experimental demonstration and verification
- Purpose of this talk
    - Expose to technical jargon and notation
    - Transmit conceptual understanding
    - Share my process of discovery
    - Share my experience with contemporary research

# Quantum Mechanics

$$H|\psi\rangle = -i\hbar \frac{\partial}{\partial t} |\psi\rangle$$

Quantum Mechanics =  
Schrodinger Equation +  
Collapse Postulate

**Schrodinger Equation** : Normal evolution in time

$$M|\psi\rangle \xrightarrow{\text{yields}} |\varphi_r\rangle \text{ with prob. } P_r = |\langle\psi|\varphi_r\rangle|^2$$

**Collapse Postulate** : Instantaneous effects of measurement

# What Is Left To Discuss?

Real world measurements:

Require Finite Time

the process stops part way through?

Include Noise

there is not a clean result?

What if:

$M|\psi\rangle$  yields  $\longrightarrow$  ? with prob.  $P = ?$

Keywords:

POVM, restricted path integral, quantum trajectories, quantum filtering, quantum jumps, stochastic master equation, etc.

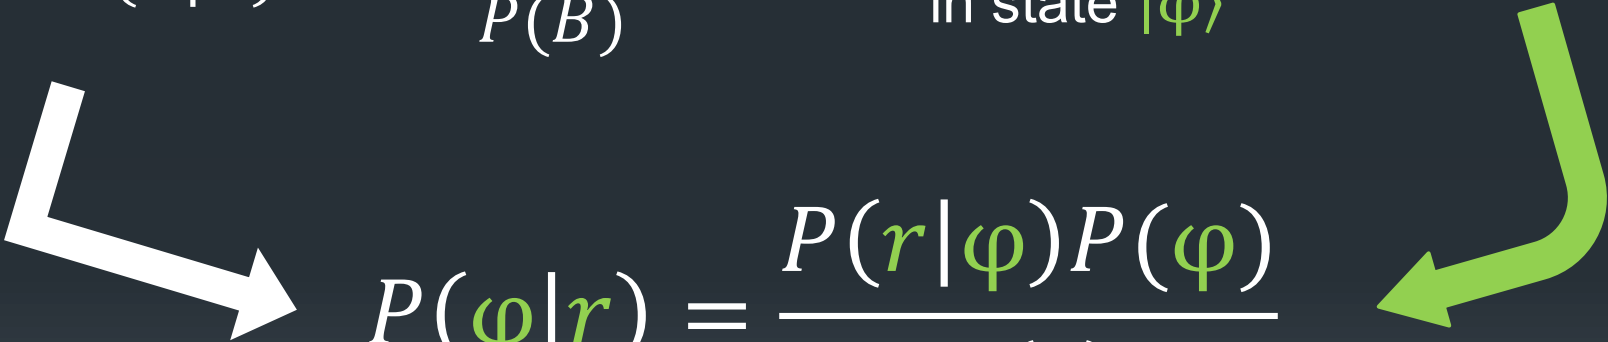

# Bayesian Formalism

Bayes' Theorem  
(conditional probability)

$$P(A|B) = \frac{P(B|A)P(A)}{P(B)}$$

Born's Rule

$P(\varphi) = |\langle \psi | \varphi \rangle|^2$  is the probability that the system is in state  $|\varphi\rangle$

$$P(\varphi|r) = \frac{P(r|\varphi)P(\varphi)}{P(r)}$$

Collapse Postulate is a Special Case

$$P(\varphi_r|r) = 1$$

# Representing a Qubit State

Vector decomposition in Euclidean space

$$\vec{r}(t) = c_x(t) \hat{i} + c_y(t) \hat{j}$$

State representation using fixed basis

$$|\psi(t)\rangle = \alpha(t)|1\rangle + \beta(t)|2\rangle$$

Slight technical difference:  
 $\alpha(t)$  and  $\beta(t)$  are complex numbers

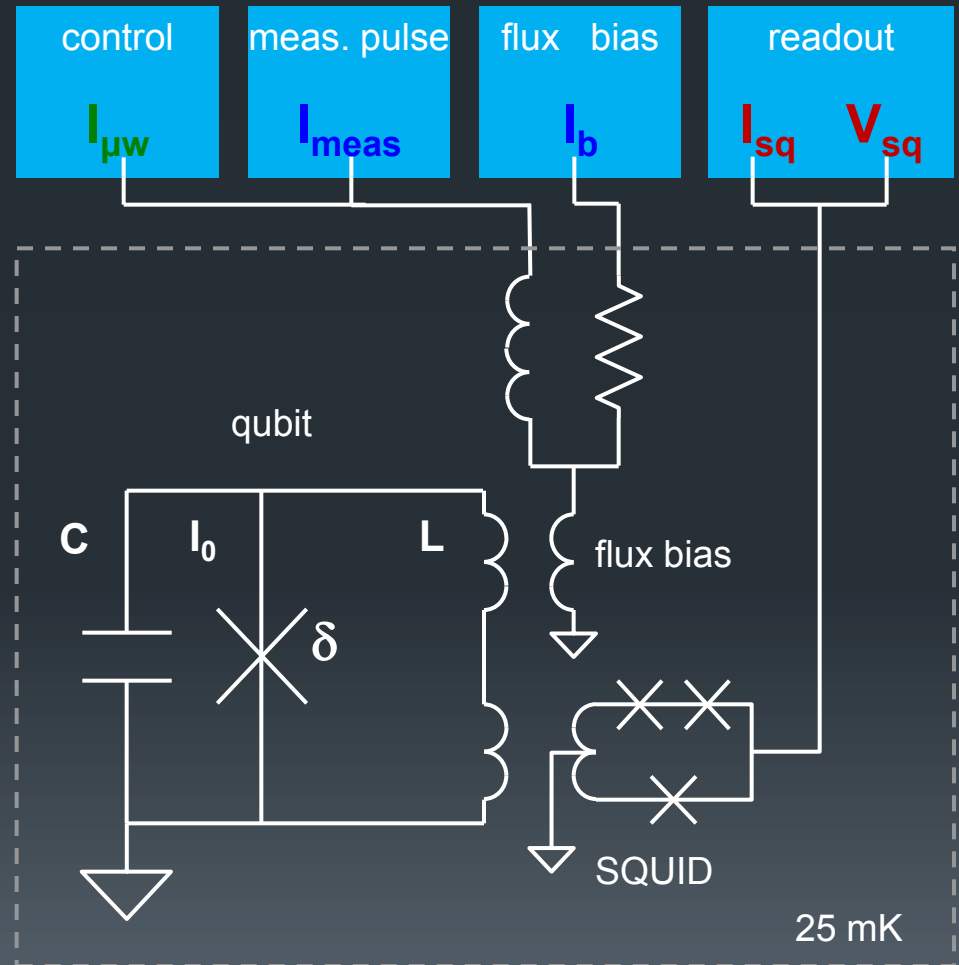

Usually time dependence is implied

$$|\psi\rangle = \alpha|1\rangle + \beta|2\rangle$$

# Example: Phase Qubit

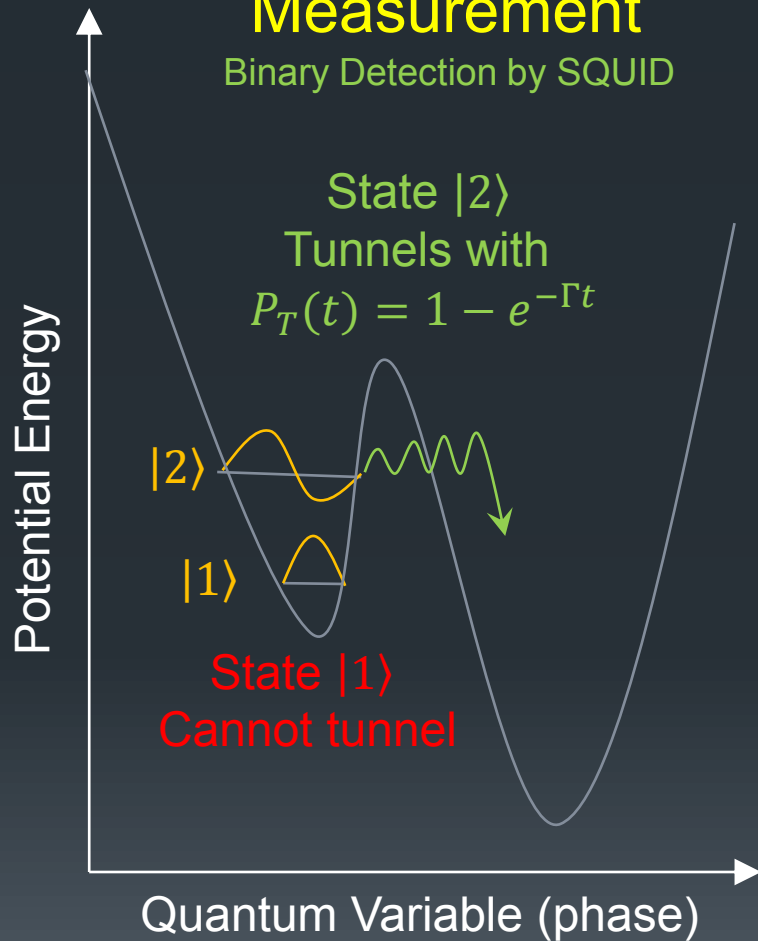

## Phase Qubit Circuit

# Example: Phase Qubit

## Measurement

Binary Detection by SQUID

## Really Bad Analogy

# Example: Phase Qubit

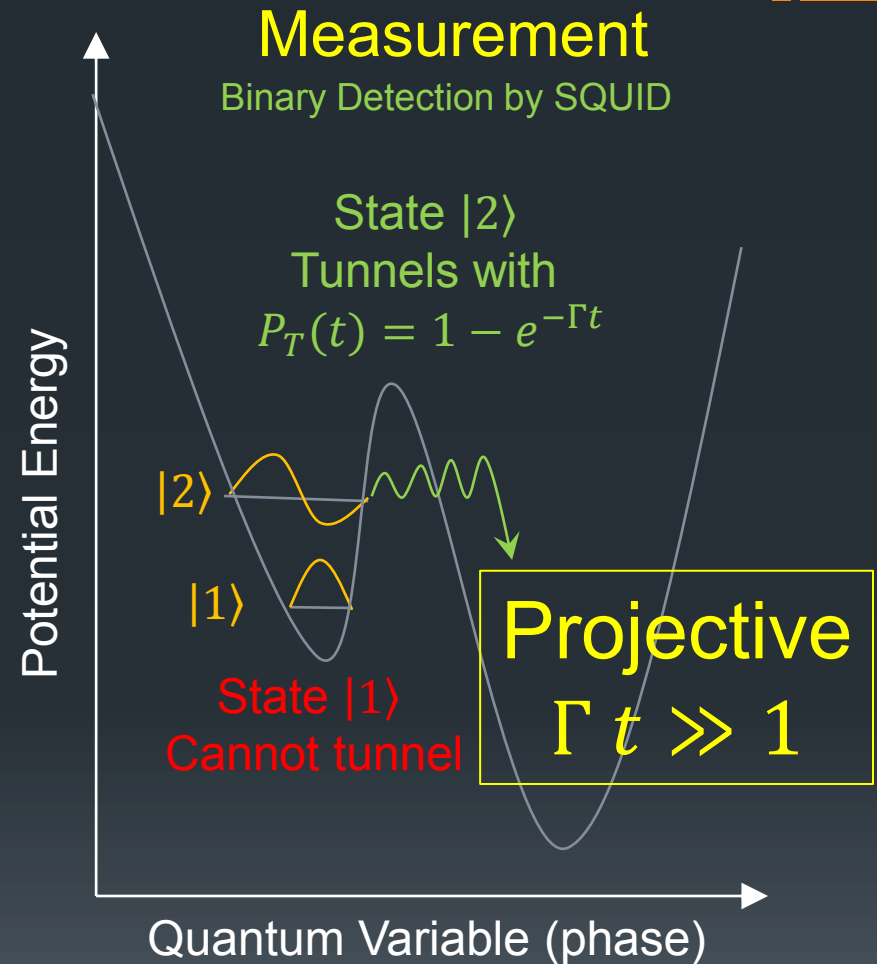

## Classical Interpretation

When tunneling is detected:  
Qubit was in state  $|2\rangle$  and  
it is now destroyed

**Destructive**

When tunneling is **NOT** detected:  
Qubit was in state  $|1\rangle$  and  
it is now in state  $|1\rangle$

**Collapse**

# Example: Phase Qubit

## Classical Interpretation

When tunneling is detected:

Qubit was in state  $|2\rangle$  and  
it is now destroyed

**SAME**

**Destructive**

When tunneling is **NOT** detected:

Qubit was in state  $|1\rangle$  and  
it is now in state  $|1\rangle$

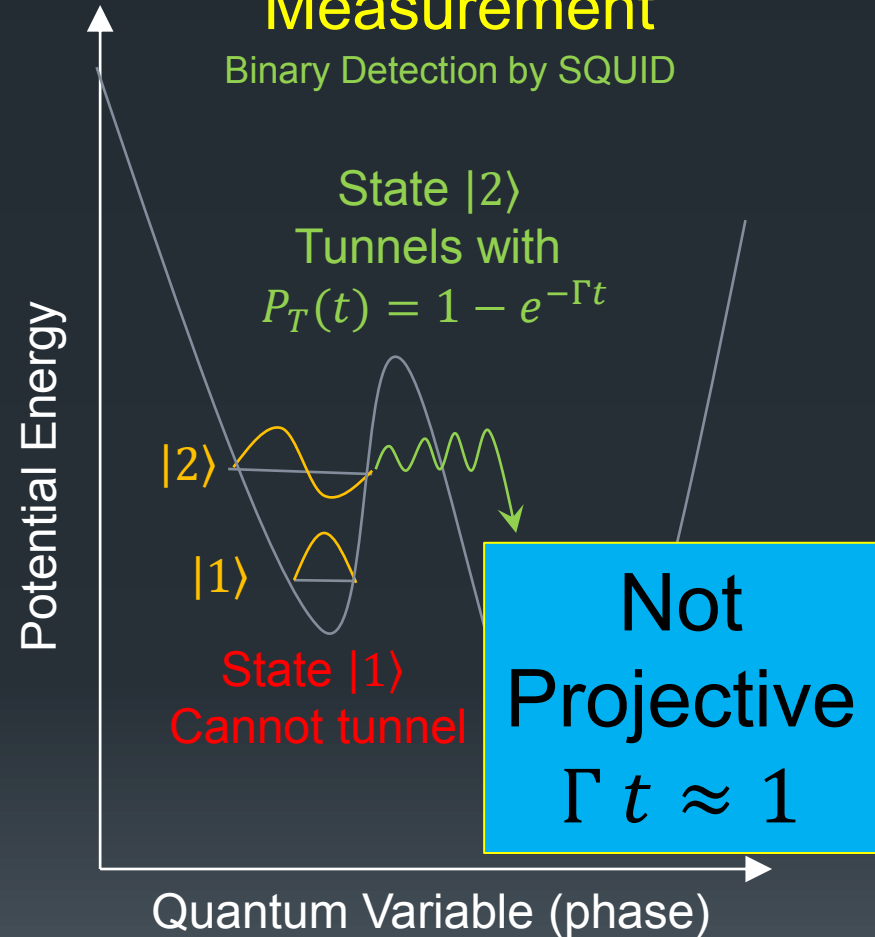

OR

Qubit was in state  $|2\rangle$ , but  
did not have the chance to tunnel and  
it is now in state  $|2\rangle$

**Weak  
Measurement**

**Weak  
Measurement**

Binary Detection by SQUID

Bayes' Theorem

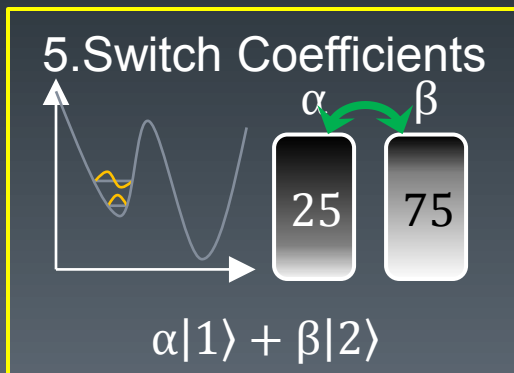

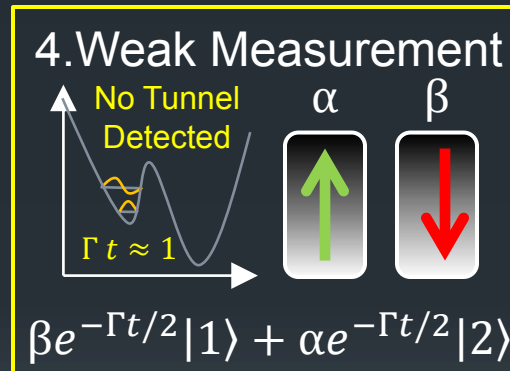

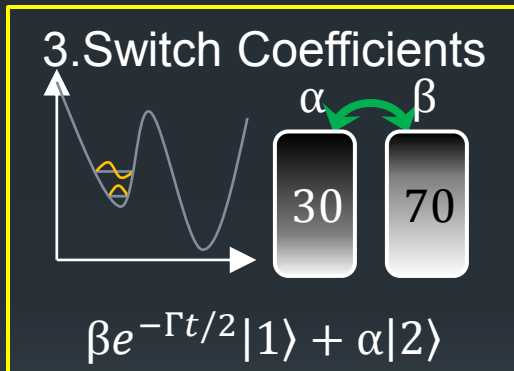

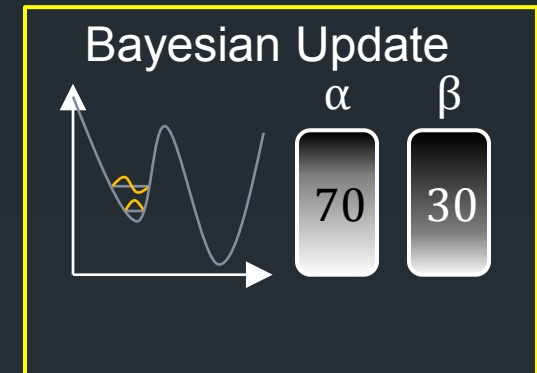

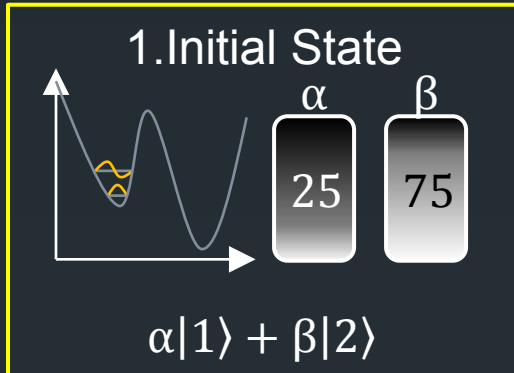

$$P(2) \rightarrow \frac{|\beta|^2 e^{-\Gamma t}}{|\alpha|^2 + |\beta|^2 e^{-\Gamma t}}$$

Born's Rule

$$\beta \rightarrow \frac{\beta e^{-\Gamma t/2}}{\sqrt{|\alpha|^2 + |\beta|^2 e^{-\Gamma t}}}$$

$M|\psi\rangle$  yields  $|\widetilde{\psi}\rangle$  with prob.  $P = |\alpha|^2 + |\beta|^2 e^{-\Gamma t}$

# Weak Measurement Reversal

**Concept: Independent of Measurement Strength**  
 Partially extract real information about state  
 Probabilistically get contradictory information  
 Best description = nothing changed

Numbers are qualitative,  $\alpha$  and  $\beta$  are complex

# Why Isn't Life Simple?

# Simulate!

## Coding Simulator

### Process

Prepare, wait,  
Measurement, wait  
Switch, wait  
Measurement, wait  
Switch

## Simulator Code

```

## Really Bad Analogy

### Relaxation

Diver gets tired from  
being nervous and dives  
into pool

# Assume a Spherical Cow

The Effect of Relaxation (T1) on Fidelity

Duration of Process = 44 ns

T1(ns) = 1, 10, 45, 100, 300, **450**, 700, 1500

$F(p=0)$

$$\frac{1}{4} \left( 1 + e^{-t/T_1} + 2e^{-t/T_2} \right)$$

Duration of Process = t

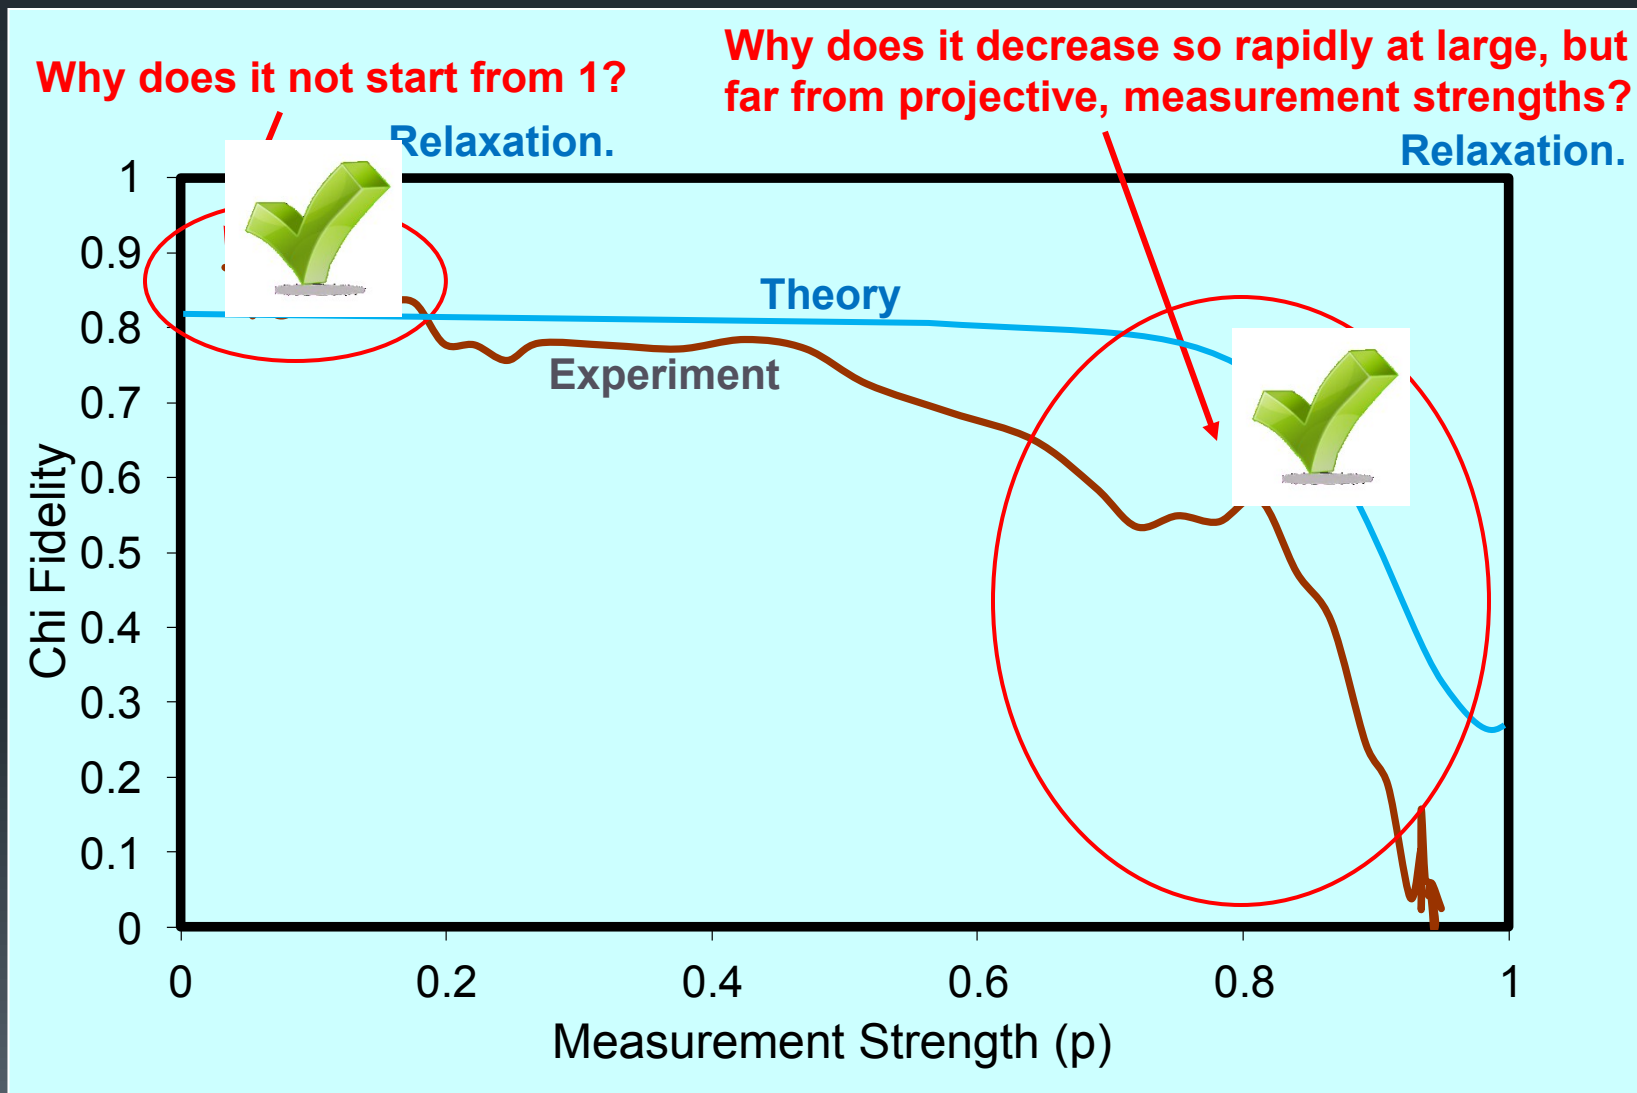

Universal Scaling of  $F(p \text{ near } 1)$

$$F_\chi = \frac{1}{4} \left( 1 + \frac{1}{1 + \frac{1}{x}} + \frac{2}{1 + \frac{1}{2x}} \right)$$

where  $x = \frac{1-p}{1 - e^{-t_3/T_1}}$

$t_3$  = the amount of time between the Pi rotation and the second measurement

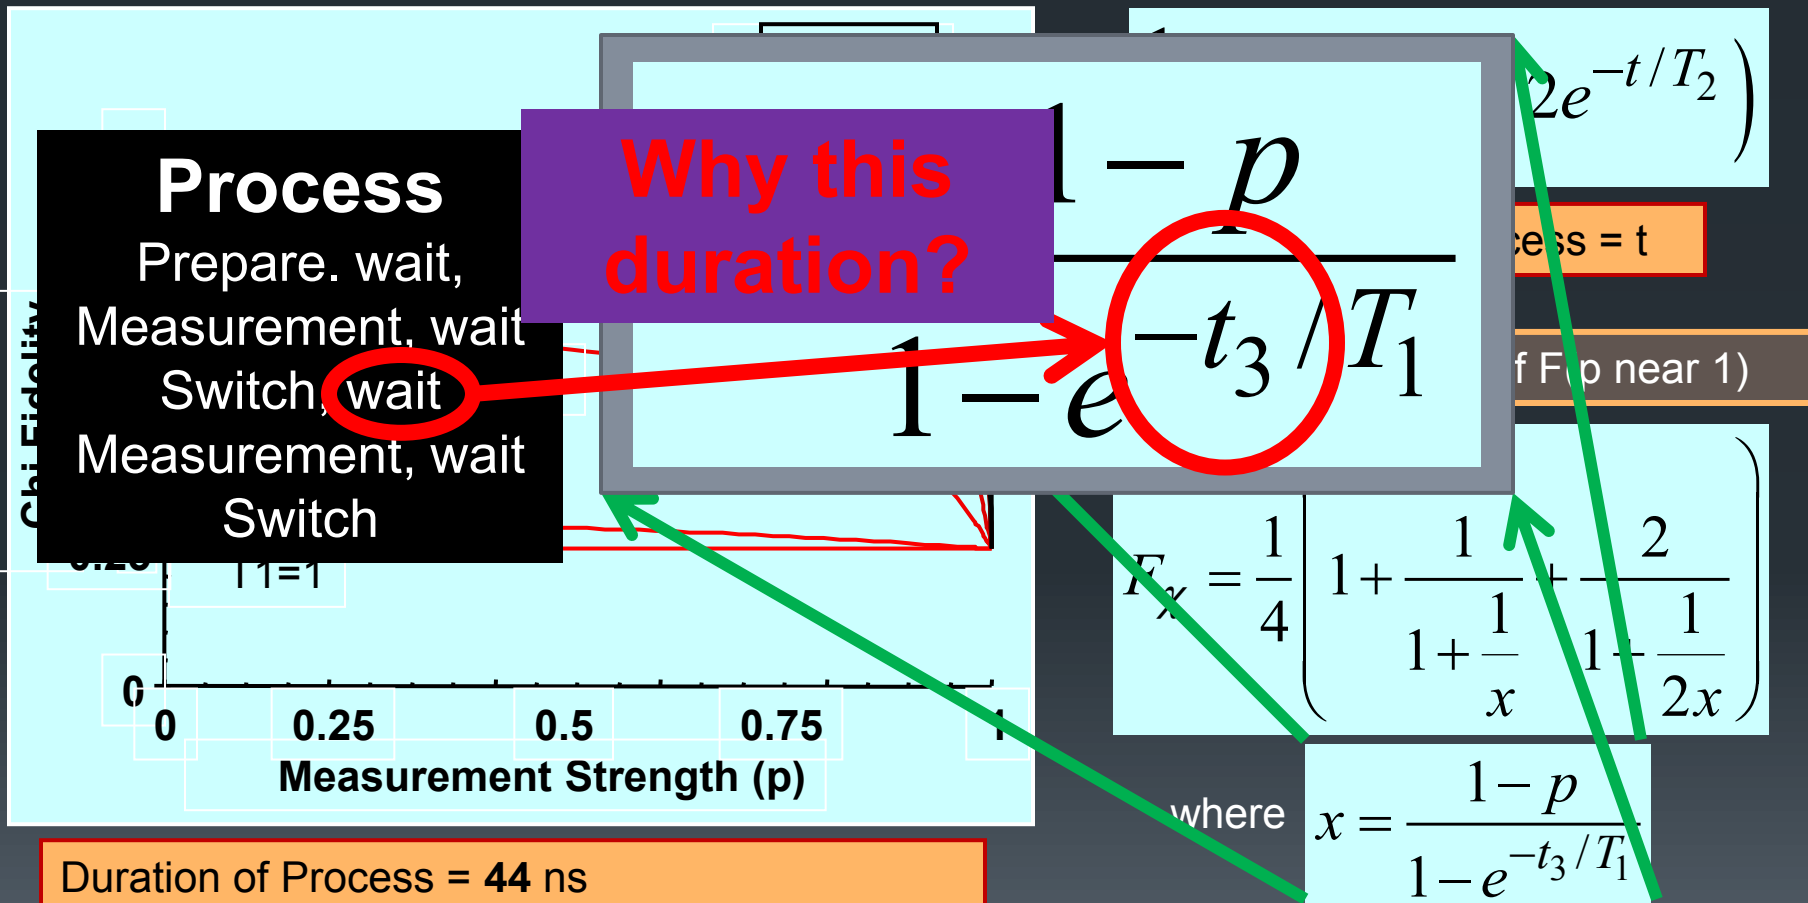

# Simple Answer: Relaxation

# But, wait... I Don't Get It

The Effect of Relaxation (T1) on Fidelity

$F(p=0)$

# When in Doubt, Turn Knobs

# Relaxation Suppression by WMR

## 1. Weak Measurement

$$\alpha|1\rangle + \beta e^{-\Gamma t/2}|2\rangle$$

## 2. Relaxation

$$\alpha|1\rangle + \beta e^{-\Gamma t/2} e^{-t/T_1}|2\rangle$$

## 3. Switch Coefficients

$$\beta e^{-\Omega t/2}|1\rangle + \alpha|2\rangle$$

Wait

## 4. Weak Measurement

$$\beta e^{-\Omega t/2}|1\rangle + \alpha e^{-Kt/2}|2\rangle$$

## 5. Switch Coefficients

$$\alpha|1\rangle + \beta|2\rangle$$

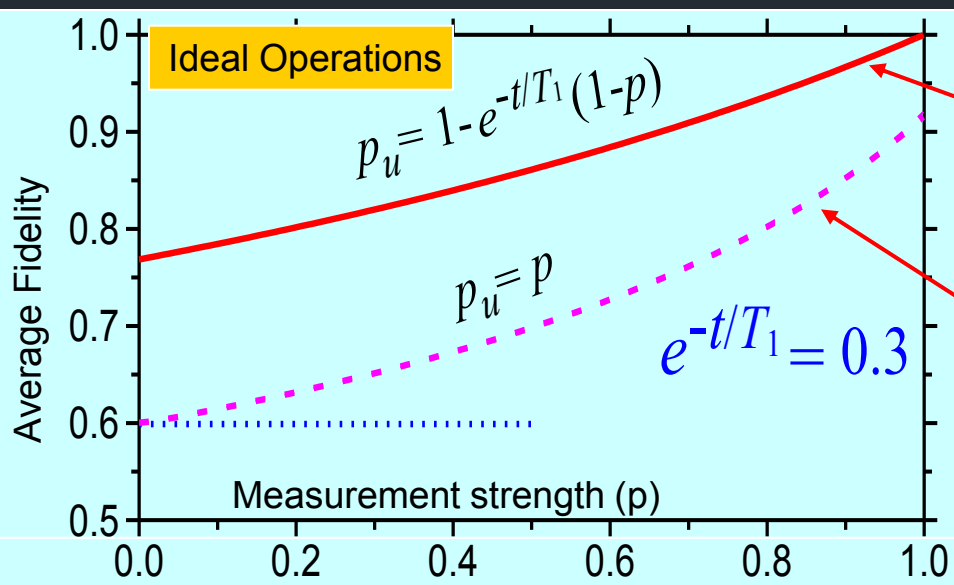

$$\alpha|1\rangle + \beta e^{-\Gamma t/2} e^{-t/T_1}|2\rangle \equiv \alpha|1\rangle + \beta e^{-\Omega t/2}|2\rangle$$

$$K \rightarrow \Omega = \Gamma + 1/T_1$$

**Concept: Preferentially Select No Relaxation**  
 Decrease Likelihood of being in  $|2\rangle$   
 Relaxation Naturally Suppressed  
 Reverse Measurement and Relaxation

Numbers are qualitative,  $\alpha$  and  $\beta$  are complex

# Published New Protocol

-Wise choice of uncollapsing measurement strength will return a state that is arbitrarily close to the initial state

- Even a bad choice of uncollapsing strength will yield an improvement over pure relaxed state

-Ideal operations with relaxation and dephasing during the error period, the ideally returned state is only slightly degraded

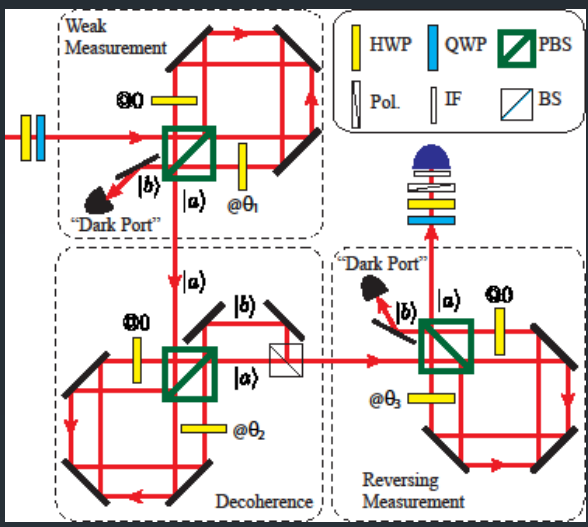

- Improvement is still realizable in the presence of considerable decoherence during the operations, although perfect restoration is no longer achievable

# Life Goes On...

# Experiment in Optics Express

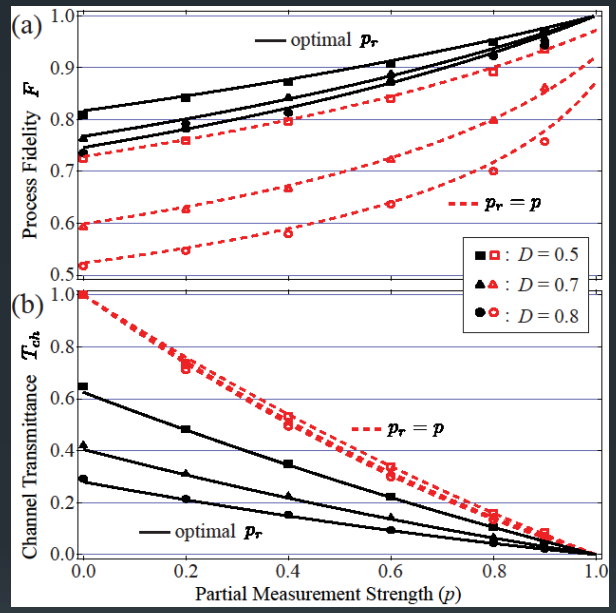

## Optical Circuit

Weak Measurement realized with Polarization Beam Splitter, Half Wave Plate, and Dark Port

Relaxation realized with similar components, except no dark port

## Results

**Nearly exact match to theory!!!**

Jong-Chan Lee, Youn-Chang Jeong, Yong-Su Kim, and Yoon-Ho Kim, "Experimental demonstration of decoherence suppression via quantum measurement reversal," Opt. Express **19**, 16309-16316 (2011)

## Happy Grad Student

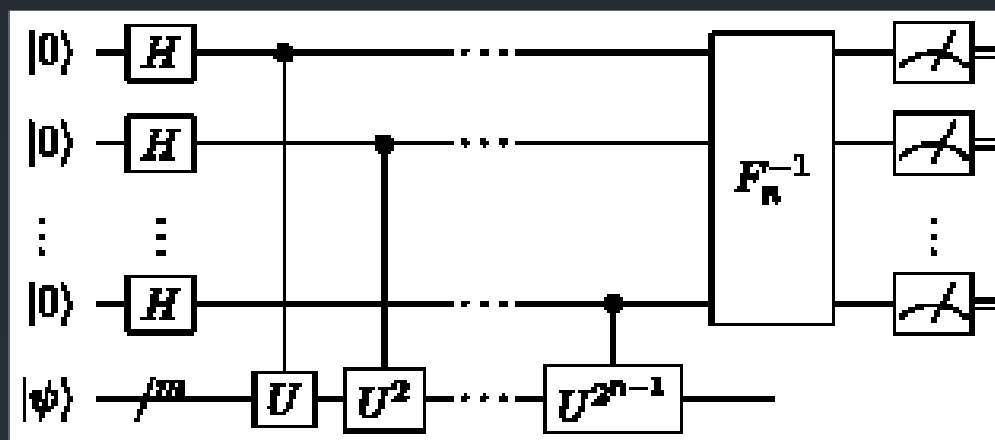

Eventually, everything seems to work out or fizzle away.

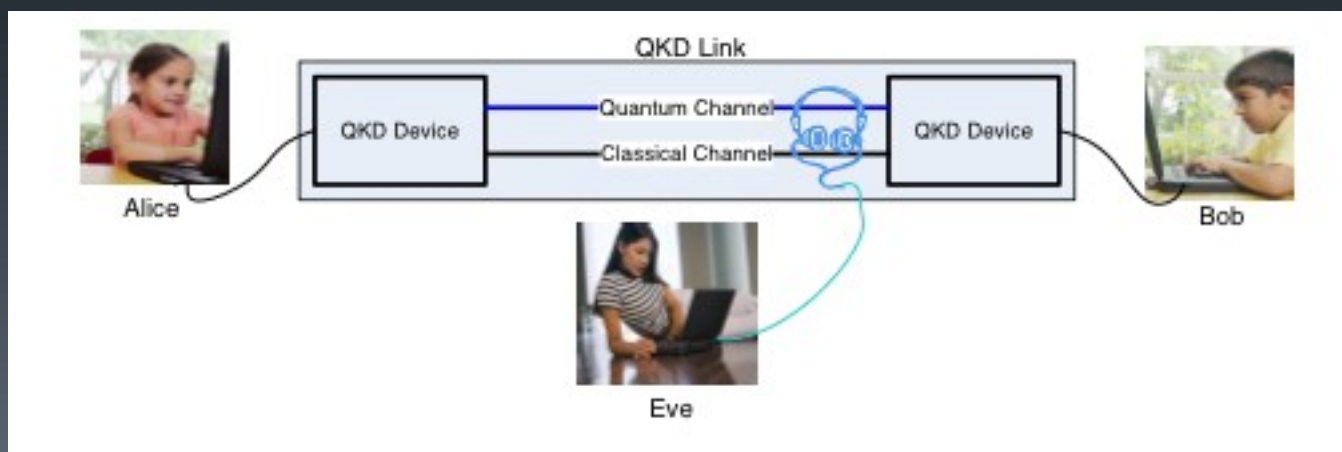

This was a good moment

# Applications

Protect a qubit during use in a quantum computer

Protect information from relaxation during distribution of quantum cryptographic key

# Conclusions

Weak measurement is consistent with the interpretation that the wave function is a reflection of our best information

New information creates a continuous change if we acknowledge and adapt to it

Weak measurements are reversible, but there is a probability of failure

Even mundane tasks can lead to discoveries

Unexpectedly, weak measurement reversal has a purpose as a decoherence suppression technique for relaxation (Quantum Error Correction)

# YES WE CAN!

(Get into graduate school, work really hard, give up our social lives, find an advisor, struggle to catch up with a progressing field, figure out that we do not like the field, find a new advisor, learn jargon, program code, and **fake it until we make it**)
